1. What are Hooks in React?

React components usually functions hote hain. Hooks special functions hain jo functional components ko React features use karne dete hain, jaise state manage karna, side effects handle karna, aur shared logic reuse karna.

Example: React mein kisi button par click karne ke baad number increase karna hai. Iske liye hum useState Hook use kar sakte hain.

Important Hooks:

Hook	Purpose
useState	Component ka data manage karna
useEffect	Side effects handle karna, jaise API calls
useContext	Components ke beech shared data access karna
useRef	Value ya DOM reference store karna
useMemo	Expensive calculations ka result cache karna
useCallback	Function references ko cache karna

Abhi tumhe pehle useState aur useEffect achhe se seekhne hain.

Interview definition:

Hooks are special React functions that allow functional components to use features such as state, context, and side-effect management.

2. What is the useState Hook?

Maan lo tum ek counter bana rahe ho.

Button par click karne se number 0 → 1 → 2 → 3 hona chahiye.

React ke bina JavaScript mein tum DOM ko manually update kar sakte ho. React mein hum state update karte hain aur React UI ko accordingly update karta hai.

useState isi purpose ke liye use hota hai.

```
const Counter = () => {
    const [count, setCount] = useState(0);
  return (
    <div className='counter-container'>
        <p id='para'>You have clicked {count} times</p>
        <button id='btn' onClick={()=> { setCount(count+1) }} >Click me</button>
    </div>
  )
}

export default Counter
```
